DAIS - Università Ca'Foscari di Venezia

Academic year: 2021/2022

#### WebSocket

Protocol that allows a simple **full-duplex** communication using an underlying TCP/IP connection.

Designed to be compatible with HTTP

- Same ports
- Initial handshake based on HTTP
- Proxy support

# Full-duplex

Unlike the HTTP protocol, once a WebSocket connection has been established, the exchange of messages can take place indifferently and simultaneously between client and server

Overcomes the HTTP request-response model

#### WebSocket

Can be used inside the web browser or standalone.

WebSocket is designed to allow the transport of messages in a **bidirectional way** in web-based applications (therefore within the browser)

#### WebSocket

#### Two high-level components:

- 1. Handshake protocol, based on HTTP, to negotiate the connection parameters and establish a communication channel
- 2. A framing mechanism to transfer binary/ascii data with the following features:
  - a. Very low overhead
  - b. Low latency

#### WebSocket handshake

The WebSocket communication channel is established from an existing HTTP connection.

- HTTP Upgrade header used to negotiate a protocol switch
- This mechanism allows the crossing of proxies supporting the WebSocket protocol
- Designed to prevent malicious attacks

GET /socket HTTP/1.1

Host: thirdparty.com

Origin: http://example.com

Connection: Upgrade Upgrade: websocket

Sec-WebSocket-Version: 13

Sec-WebSocket-Key: dGhlIHNhbXBsZSBub25jZQ==

Sec-WebSocket-Protocol: appProtocol,appProtocol-v2

Sec-WebSocket-Extensions: x-webkit-deflate-

message, x-custom-extension

Handshake begins with a GET request to a certain server's resource

```
GET /socket HTTP/1.1
Host: thirdparty.com
Origin: http://example.com
```

Connection: Upgrade Upgrade: websocket 4

Sec-WebSocket-Version: 13

Sec-WebSocket-Key: dGhlIHNhbXBsZSBub25jZQ==

Sec-WebSocket-Protocol: appProtocol,appProtocol-v2

Sec-WebSocket-Extensions: x-webkit-deflate-

message, x-custom-extension

Client asks for a protocol switch from HTTP to WebSocket

Client's supported GET /socket HTTP/1.1 WebSocket version Host: thirdparty.com Origin: http://example.com Connection: Upgrade Upgrade: websocket Sec-WebSocket-Version: 13 Sec-WebSocket-Key: dGhlIHNhbXBsZSBub25jZQ== Sec-WebSocket-Protocol: appProtocol,appProtocol-v2 Sec-WebSocket-Extensions: x-webkit-deflatemessage, x-custom-extension

```
GET /socket HTTP/1.1

Host: thirdparty.com

Origin: http://example.com

Connection: Upgrade

Upgrade: websocket

Sec-WebSocket-Version: 13

Sec-WebSocket-Key: dGhlIHNhbXBsZSBub25jZQ==

Sec-WebSocket-Protocol: appProtocol, appProtocol-v2

Sec-WebSocket-Extensions: x-webkit-deflate-
message, x-custom-extension
```

Random string encoded in base-64 used to:

- Verify if the server support the protocol
- Invalidate proxy caches and avoid duplicate handshakes

```
GET /socket HTTP/1.1
Host: thirdparty.com
Origin: http://example.com
Connection: Upgrade
Upgrade: websocket
Sec-WebSocket-Version: 13
Sec-WebSocket-Key: dGhlIHNhbXBsZSBub25jZQ==
Sec-WebSocket-Protocol: appProtocol, appProtocol-v2
Sec-WebSocket-Extensions: x-webkit-deflate-
message, x-custom-extension

List of sub-protocols and extension that might be
used
```

```
HTTP/1.1 101 Switching Protocols
Upgrade: websocket
Connection: Upgrade
Access-Control-Allow-Origin: http://example.com
Sec-WebSocket-Accept: s3pPLMBiTxaQ9kYGzzhZRbK+x0o=
Sec-WebSocket-Protocol: appProtocol-v2
Sec-WebSocket-Extensions: x-custom-extension
Response code to acknowledge the protocol switch
```

```
HTTP/1.1 101 Switching Protocols
```

Upgrade: websocket Connection: Upgrade

Access-Control-Allow-Origin: http://example.com

Sec-WebSocket-Accept: s3pPLMBiTxaQ9kYGzzhZRbK+x0o=

Sec-WebSocket-Protocol: appProtocol-v2

Sec-WebSocket-Extensions: x-custom-extension

Hash of the key sent on the previous request + a predefined string depending by the protocol

```
HTTP/1.1 101 Switching Protocols
```

Upgrade: websocket Connection: Upgrade

Access-Control-Allow-Origin: http://example.com

Sec-WebSocket-Accept: s3pPLMBiTxaQ9kYGzzhZRbK+x0o=

Sec-WebSocket-Protocol: appProtocol-v2

Sec-WebSocket-Extensions: x-custom-extension

Sub-protocol to use and supported extensions

#### Handshake

After the exchange of request-response messages:

- TCP (or SSL/TLS) connection is kept open
- New messages are exchanged according to WebSocket protocol (HTTP is not used anymore)

### WebSocket messages

- Protocol allows the exchange of binary or text messages (UTF-8) of arbitrary length
- Communication is full-duplex. Both client and server can pre-emptively send a message when needed. The other peer is notified when a new message arrives
- Messages are divided in frames, each frame is sent sequentially and reassembled at destination

Bit	+07			+815		+1623	+2431
0	FIN Opcode			Mask	Length	Extended length (0—8 bytes)	
32							
64						Masking key (0–4 bytes)	
96						Payload	

Variable frame overhead (2 to 10 bytes). All messages sent by the client contain a masking key (0-4 bytes) causing an additional overhead from 6 to 14 bytes

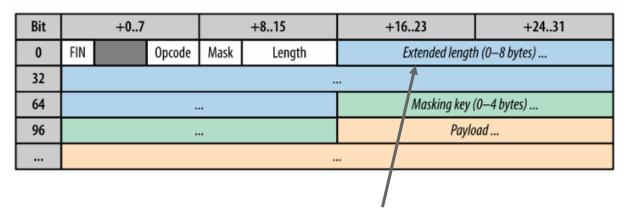

- o: Some other frames are needed to complete the message
- 1: Message is completed with this frame

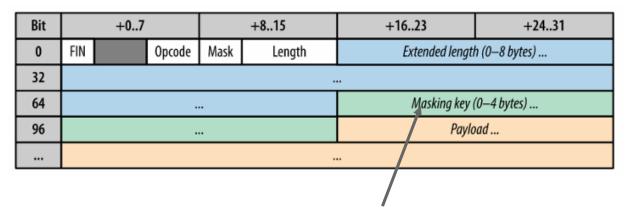

Message type: text (1), binary (2), close (8), ping (9), pong (10)

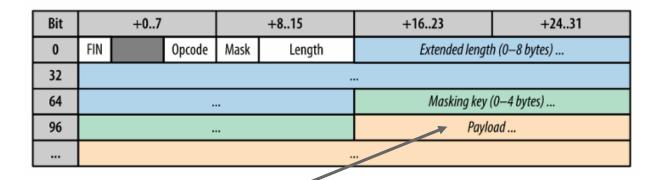

- 0: Frame is NOT masked
- 1: Frame is masked

Message length (one or more bytes)

Payloads of all client-initiated messages are masked (XOR) with this key to avoid «cache poisoning» attacks.

Message payload

# **Framing**

Messages are framed for two reasons:

- 1. Messages can be transferred without knowing their size in advance (infinite streams are also possible)
- 2. Frames belonging to different messages can be interleaved to reduce the latency (higher priority can be given to small messages)

## WebSocket in JavaScript

WebSocket is supported in the vast majority of existing web browsers.

Socket.io library simplifies the development of WebSocket applications in JavaScript

https://socket.io/ socket.io

Allows the asynchronous exchange of «events» between client and server, and vice versa
